# Class 14: RNA Seq Mini Project

Olivia Baldwin

### Import Data

Counts and Metadata Counts are the colData that DESeq calls for.

```
counts <- read.csv("GSE37704_featurecounts.csv", row.names = 1)
metadata <- read.csv("GSE37704_metadata.csv")
```

### Data CleanUp

Start with an inspection of the data.

```
head(counts)
```

```
                length SRR493366 SRR493367 SRR493368 SRR493369 SRR493370
ENSG00000186092    918         0         0         0         0         0
ENSG00000279928    718         0         0         0         0         0

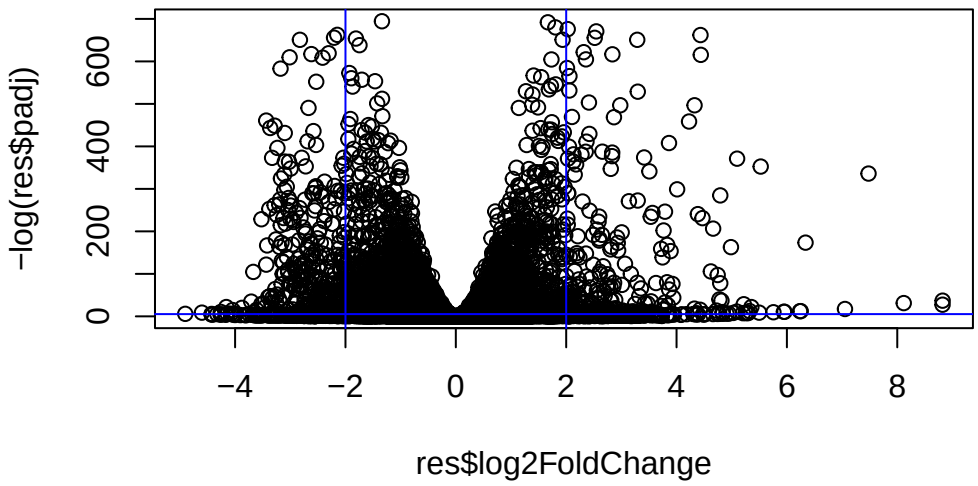
abline(v=c(2, -2), col= "blue")
abline(h=-log(0.005), col = "blue")
```



## Pathway Analysis

### Annotation

First I need to translate my Ensemble IDs in my `res` object to Entrez and gene symbol formats.

For this I will use the AnnotationDbi package and the `mapIds()` function.

Lets map to SYMBOL, ENTREZID, and GENENAME.

```
library(AnnotationDbi)
library(org.Hs.eg.db)
```

```
columns(org.Hs.eg.db)
```

```
 [1] "ACCNUM"       "ALIAS"        "ENSEMBL"      "ENSEMBLPROT"  "ENSEMBLTRANS"
 [6] "ENTREZID"     "ENZYME"       "EVIDENCE"     "EVIDENCEALL"  "GENENAME"
[11] "GENETYPE"     "GO"           "GOALL"        "IPI"          "MAP"
[16] "OMIM"         "ONTOLOGY"     "ONTOLOGYALL"  "PATH"         "PFAM"
```

```
[21] "PMID"         "PROSITE"      "REFSEQ"       "SYMBOL"       "UCSCKG"
[26] "UNIPROT"
```

```
res$genename <- mapIds(org.Hs.eg.db,
                     keys=rownames(res),
                     keytype= "ENSEMBL",
                     column = "GENENAME",
                     multiVals = "first")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$symbol <- mapIds(org.Hs.eg.db,
                     keys=rownames(res),
                     keytype= "ENSEMBL",
                     column = "SYMBOL",
                     multiVals = "first")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
res$entrez <- mapIds(org.Hs.eg.db,
                     keys=rownames(res),
                     keytype= "ENSEMBL",
                     column = "ENTREZID",
                     multiVals = "first")
```

```
'select()' returned 1:many mapping between keys and columns
```

```
head(res)
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna

```

### Filter the Data

Before going further lets focus in on a subset of "top" hits.

We can use log2FC of +2/-2 and a padj of 0.05 as a starting point.

```
top.hits <- abs(res$log2FoldChange) > 2 & res$padj < 0.05
top.hits[is.na(top.hits)] <- FALSE
```

```
look <- is.na(top.hits)
res[look, ]
```

```
log2 fold change (MLE): condition hoxa1 kd vs control sirna
Wald test p-value: condition hoxa1 kd vs control sirna
DataFrame with 0 rows and 9 columns
```

Let's save our "top genes" to a file.

```
top.genes <- res[top.hits,]
write.csv(top.genes, file="top_hits.csv")
```

### Pathway

Now we can do the pathway analysis.

```
library(pathview)
```

```
##############################################################################
Pathview is an open source software package distributed under GNU General
Public License version 3 (GPLv3). Details of GPLv3 is available at
http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to
```

```
formally cite the original Pathview paper (not just mention it) in publications
or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG
license agreement (details at http://www.kegg.jp/kegg/legal.html).
##############################################################################
```

```
library(gage)
```

```
library(gageData)

data(kegg.sets.hs)
data(sigmet.idx.hs)
```

```
#focuses in on signaling and metabolic pathways
kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]
```

The **gage** funciton wants a vector of importance as input with gene names as labels (KEGG speaks Entrez)

```
foldchanges <- res$log2FoldChange
names(foldchanges) <- res$entrez
head(foldchanges)
```

```
       <NA>      148398       26155      339451       84069       84808

### Reactome

To run reactome online we need to make a text file with a gene id per line.

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))
```

```
[1] "Total number of significant genes: 8147"
```

```
write.table(sig_genes, file="significant_genes.txt",
            row.names=FALSE,
            col.names=FALSE,
            quote=FALSE)
```
